ESP32 Development Board

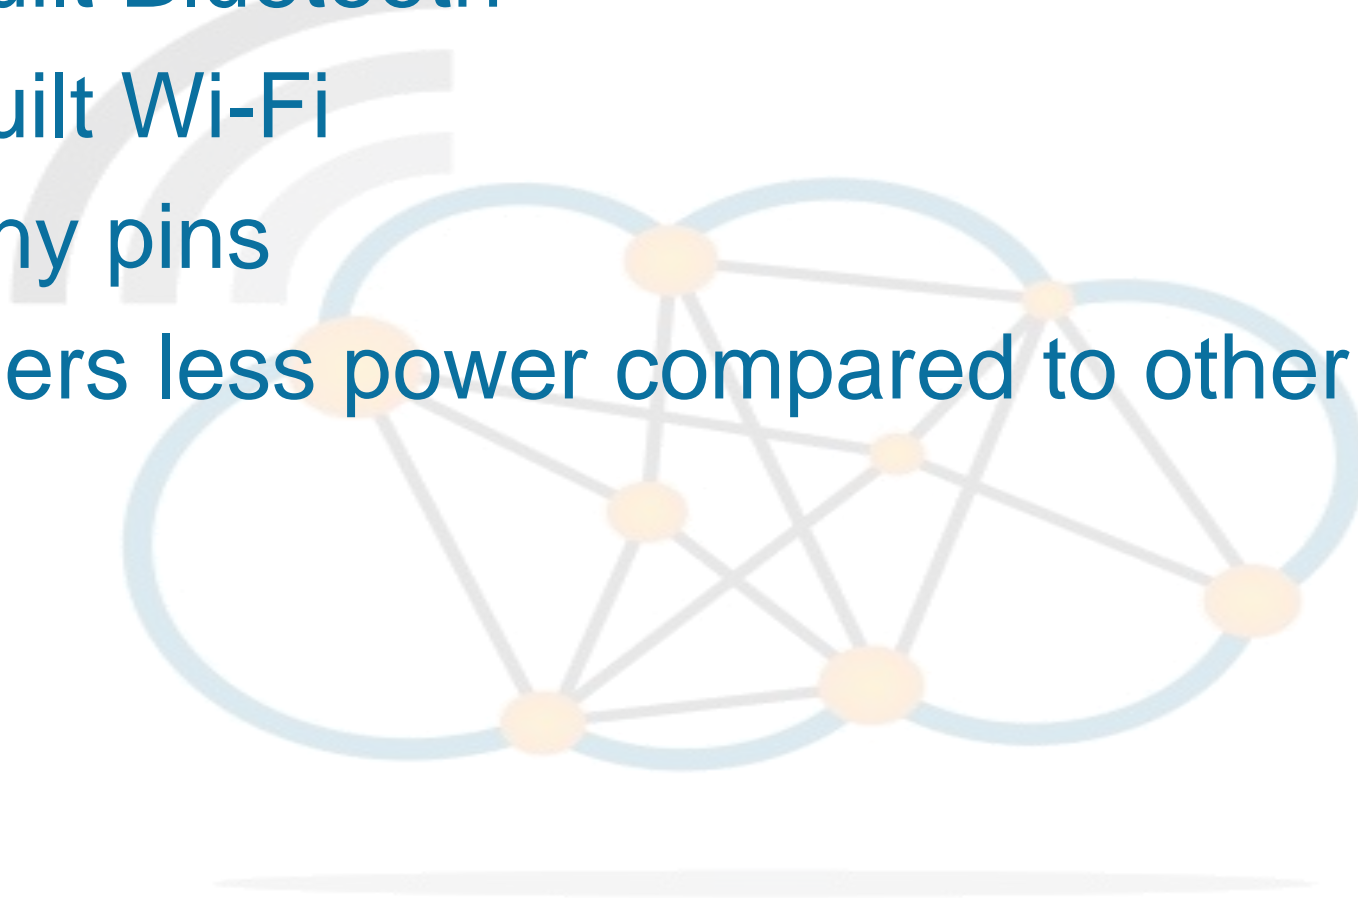

- It is a feature-rich MCU Board with integrated Wi-Fi and Bluetooth connectivity for a wide-range of applications.
- It is compatible with Arduino IDE.

Why use ESP32?

- It has inbuilt Bluetooth
- It has inbuilt Wi-Fi
- It has many pins
- It consumes less power compared to other MCU boards

Esp32 30-Pin layout

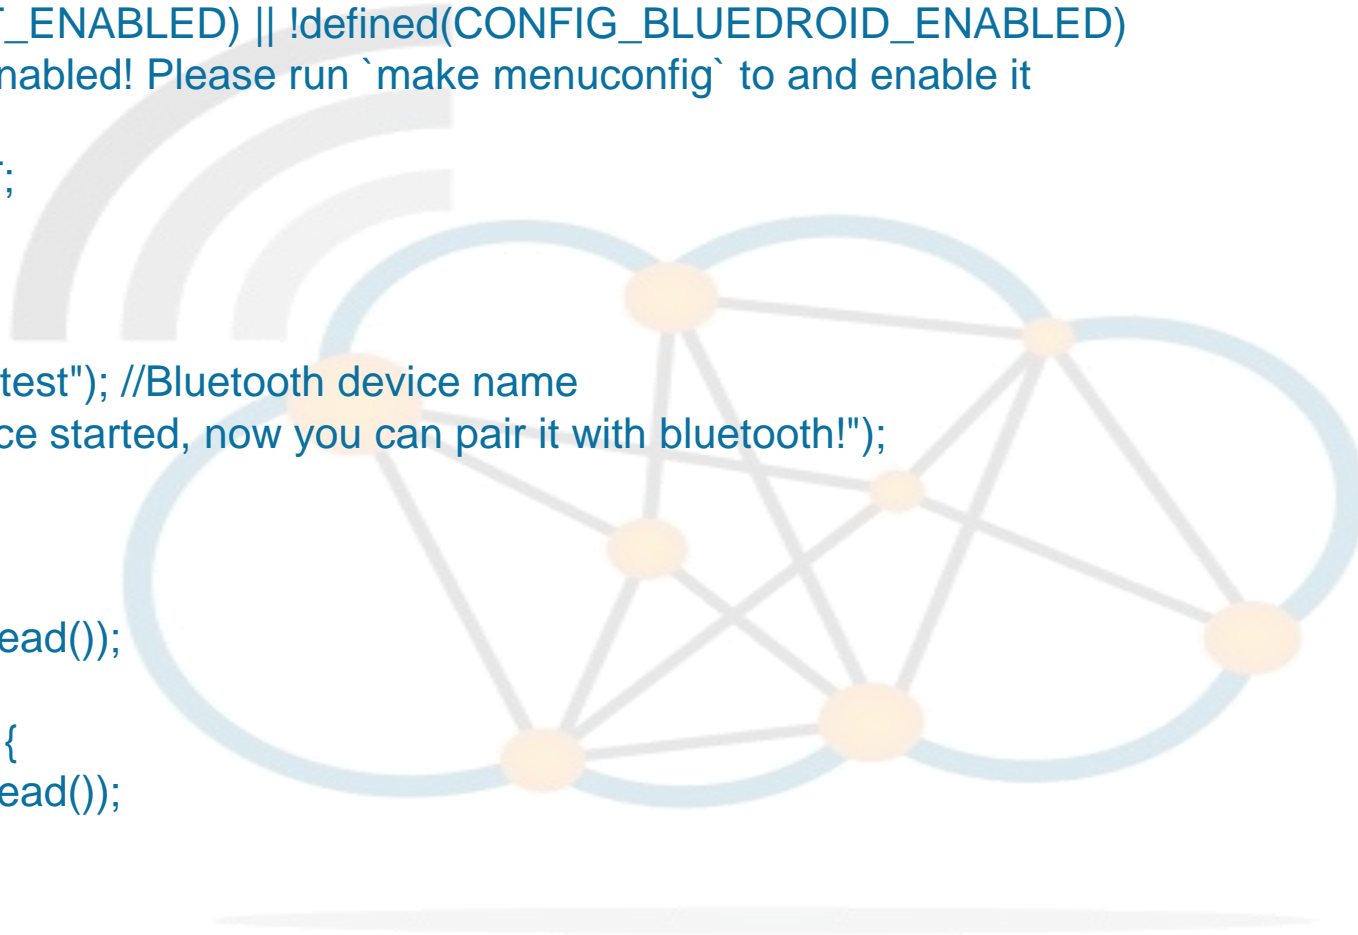

Esp32 Bluetooth

```
#include "BluetoothSerial.h"
#if !defined(CONFIG_BT_ENABLED) || !defined(CONFIG_BLUEDROID_ENABLED)
#error Bluetooth is not enabled! Please run `make menuconfig` to and enable it
#endif
BluetoothSerial SerialBT;

void setup() {
  Serial.begin(115200);
  SerialBT.begin("ESP32test"); //Bluetooth device name
  Serial.println("The device started, now you can pair it with bluetooth!");
}
void loop() {
  if (Serial.available()) {
    SerialBT.write(Serial.read());
  }
  if (SerialBT.available()) {
    Serial.write(SerialBT.read());
  }
  delay(20);
}
```

Connecting ESP 32 to a Smartphone via Bluetooth

- Download any Bluetooth Terminal application on your smartphone.
- For example “Serial Bluetooth Terminal” available in the Play Store for Android devices.
- For example “Bluetooth Terminal” available in the Apple Store for Apple devices.

- To connect to the ESP32 for the first time, you need to pair a new device.
- Go to Devices.

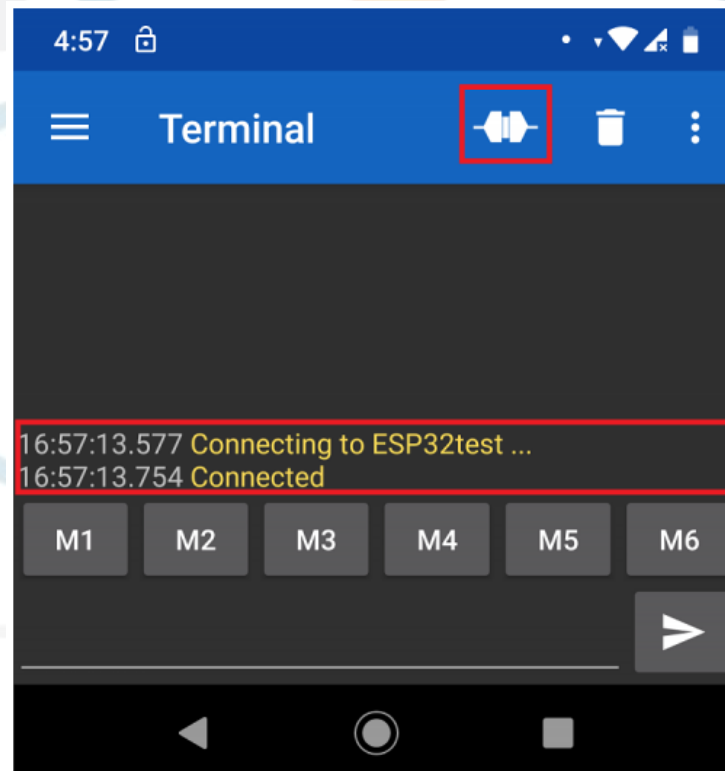

- Click the settings icon, and select Pair new device.
- You should get a list with the available Bluetooth devices, including the ESP32test. Pair with the ESP32test.

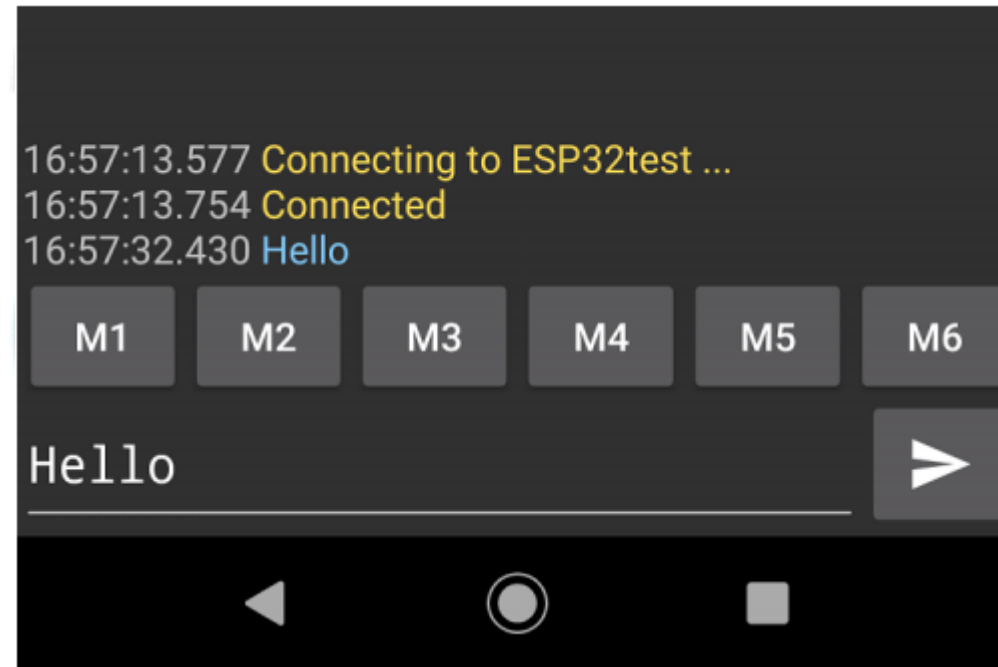

- Then, go back to the Serial Bluetooth Terminal. Click the icon at the top to connect to the ESP32.
- You should get a “Connected” message.

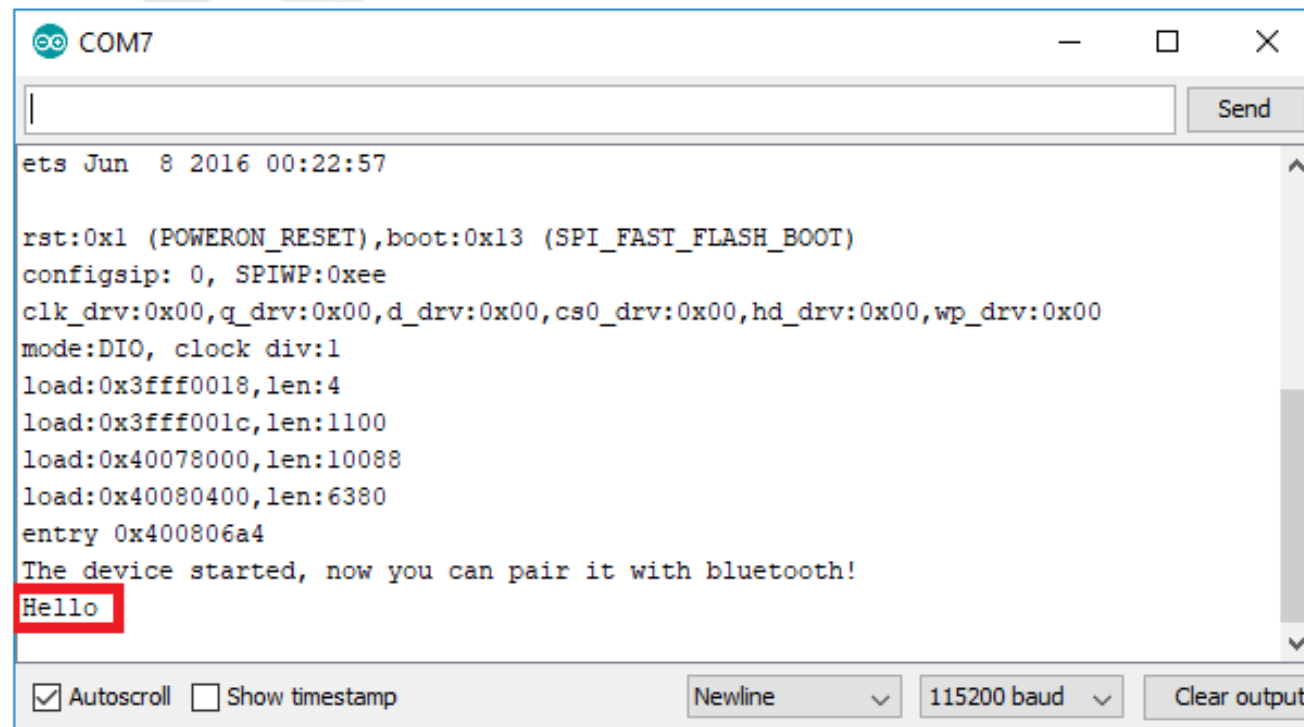

- After that, type something in the Serial Bluetooth Terminal app. For example, “Hello”.

- You should instantly receive that message in the Arduino IDE Serial Monitor.

The screenshot shows the Arduino IDE Serial Monitor window titled 'COM7'. It contains a text input field at the top with a 'Send' button. The output area displays the following text:

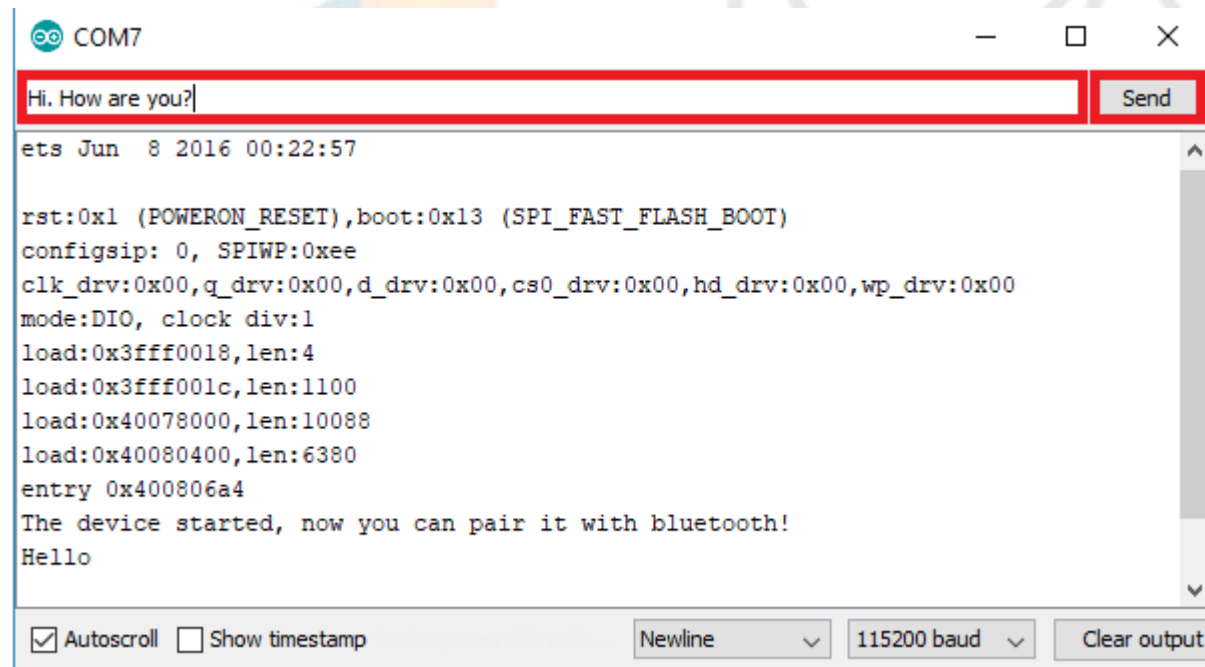

```
ets Jun  8 2016 00:22:57

rst:0x1 (POWERON_RESET),boot:0x13 (SPI_FAST_FLASH_BOOT)
configsip: 0, SPIWP:0xee
clk_drv:0x00,q_drv:0x00,d_drv:0x00,cs0_drv:0x00,hd_drv:0x00,wp_drv:0x00
mode:DIO, clock div:1
load:0x3fff0018,len:4
load:0x3fff001c,len:1100
load:0x40078000,len:10088
load:0x40080400,len:6380
entry 0x400806a4
The device started, now you can pair it with bluetooth!
Hello
```

At the bottom of the window, there are checkboxes for 'Autoscroll' (checked) and 'Show timestamp' (unchecked). To the right of these are dropdown menus for 'Newline' and '115200 baud', and a 'Clear output' button.

- You can also exchange data between your Serial Monitor and your smartphone.
- Type something in the Serial Monitor top bar and press the “Send” button.

- You should instantly receive that message in the Serial Bluetooth Terminal App.

Esp32 Wi-Fi Access point

Esp32 Wi-Fi Connections Access point

```
#include <WiFi.h>

const char* ssid = "ESP32" // SSID Name
const char* password = "jrs123"; // SSID Password - Set to NULL to have an open AP

void setup()
{
  Serial.begin(115200);
  Serial.println("Creating AP");
  WiFi.mode(WIFI_AP);
  WiFi.softAP(ssid, password);
  Serial.print("AP Created with IP Gateway ");
  Serial.println(WiFi.softAPIP());
}

void loop(){}

```

Creating an Open Access Point

```
#include <WiFi.h>
```

```
const char* ssid = "ESP32"  
const char* password = NULL;
```

```
void setup()  
{  
  Serial.begin(115200);  
  Serial.println("Creating AP");  
  WiFi.mode(WIFI_AP);  
  WiFi.softAP(ssid, password);  
  Serial.print("AP Created with IP Gateway ");  
  Serial.println(WiFi.softAPIP());  
}
```

```
void loop(){}  
}
```

Wi-Fi Access Point Customization

```
#include <WiFi.h>
```

```
const char* ssid      = "ESP32";           // SSID Name
const char* password   = "jrs123";         // SSID Password - Set to NULL to have an open AP
const int  channel     = 10;               // WiFi Channel number between 1 and 13
const bool hide_SSID   = false;            // To disable SSID broadcast -> SSID will not appear in a basic WiFi scan
const int  max_connection = 2;            // Maximum simultaneous connected clients on the AP
```

```
void setup()
{
  Serial.begin(115200);
  Serial.println("Creating AP");
  WiFi.mode(WIFI_AP);
  WiFi.softAP(ssid, password, channel, hide_SSID, max_connection);
  Serial.print("AP Created with IP Gateway ");
  Serial.println(WiFi.softAPIP());
}
```

```
void loop(){}

```

Esp32 Wi-Fi Station

Esp32 Wi-Fi Station

```
#include <WiFi.h>

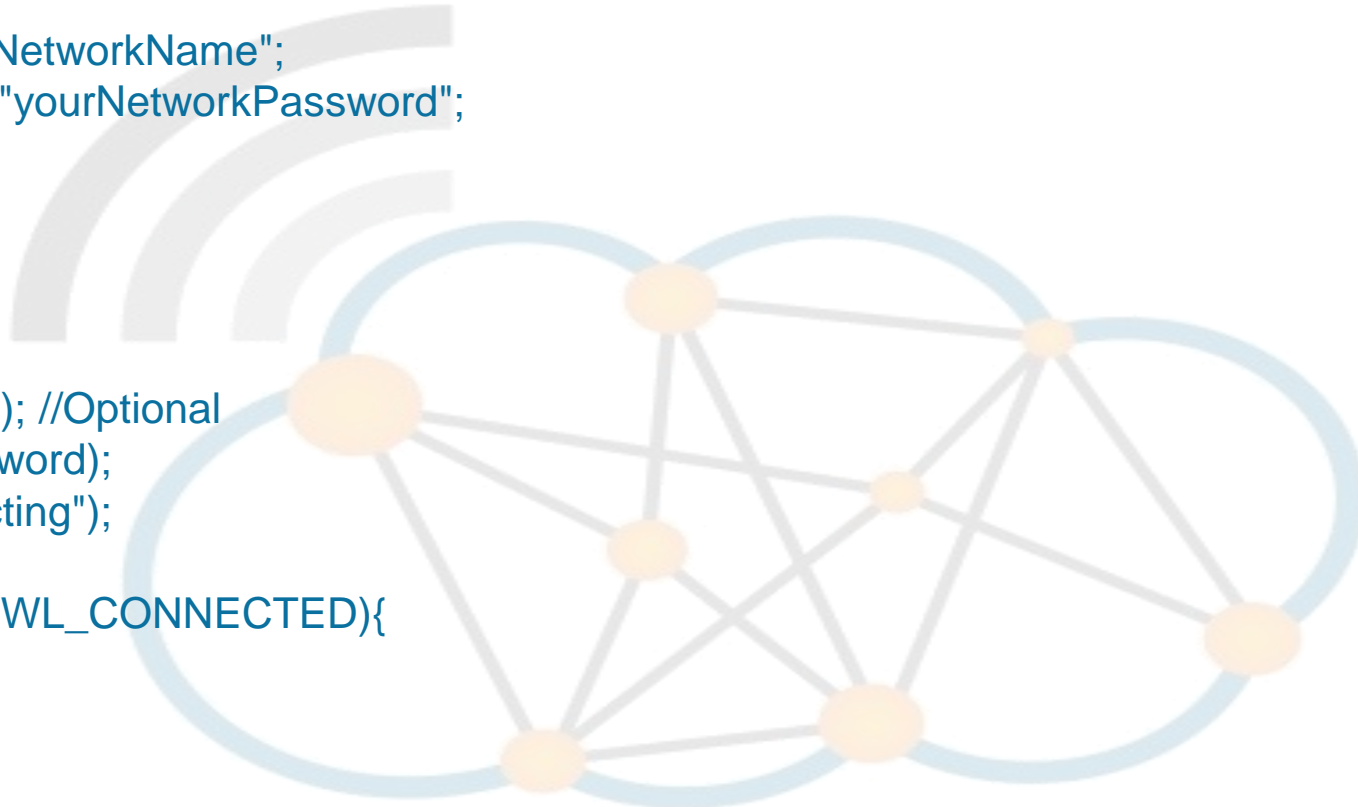

const char* ssid = "yourNetworkName";
const char* password = "yourNetworkPassword";

void setup(){
  Serial.begin(115200);
  delay(1000);

  WiFi.mode(WIFI_STA); //Optional
  WiFi.begin(ssid, password);
  Serial.println("Connecting");

  while(WiFi.status() != WL_CONNECTED){
    Serial.print(".");
    delay(100);
  }

  Serial.println("Connected to the WiFi network");
  Serial.print("Local ESP32 IP: ");
  Serial.println(WiFi.localIP());
}
```

Setting ESP32 both as Wi-Fi AP and Station

```
#include <WiFi.h>
const char* wifi_network_ssid    = "bruno";
const char* wifi_network_password = "bruno123";
const char *soft_ap_ssid        = "JRS";
const char *soft_ap_password    = NULL;
```

```
void setup()
{
  Serial.begin(115200);
  WiFi.mode(WIFI_AP_STA);

  Serial.println("Creating ESP32 AP");
  WiFi.softAP(soft_ap_ssid, soft_ap_password);
  Serial.print("AP Created with IP Gateway ");
  Serial.println(WiFi.softAPIP());

  WiFi.begin(wifi_network_ssid, wifi_network_password);
  Serial.println("Connecting to WiFi Network");

  while(WiFi.status() != WL_CONNECTED)
  {
    Serial.print(".");
    delay(100);
  }

  Serial.print("Connected to the WiFi network with local IP : ");
  Serial.println(WiFi.localIP());
}

void loop() {}
```

Sending Sensor Readings to Cloud (ThingSpeak)

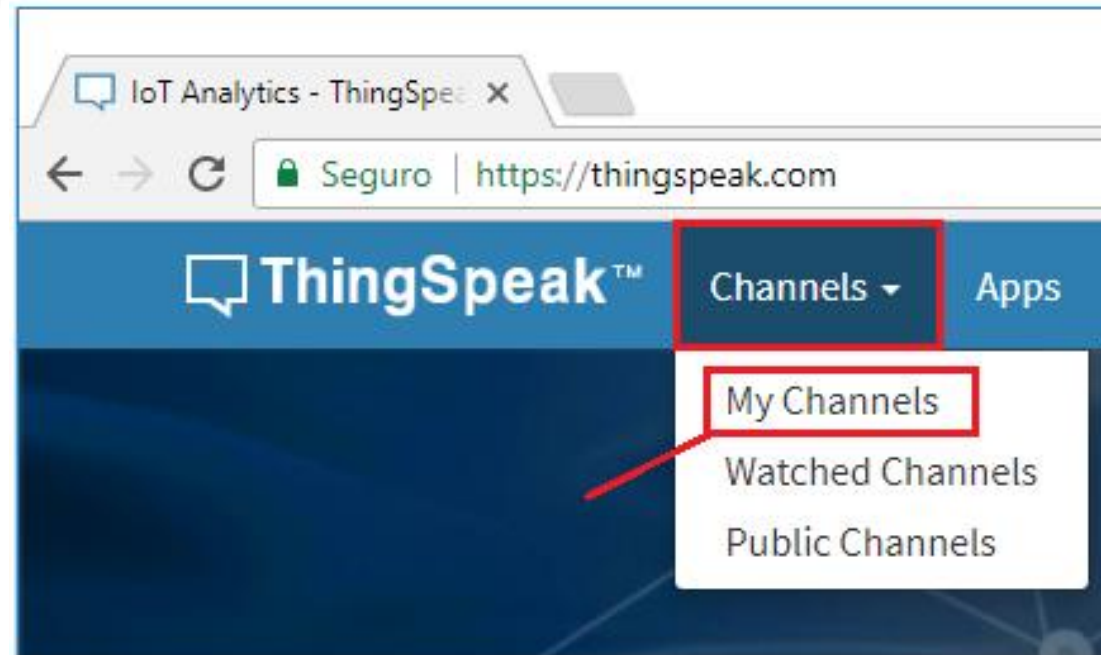

- To send sensor readings to ThingSpeak, we'll use the thingspeak-arduino library.
- You can install this library through the Arduino Library Manager. Go to Sketch > Include Library > Manage Libraries... and search for "ThingSpeak" in the Library Manager.
- Install the ThingSpeak library by MathWorks.

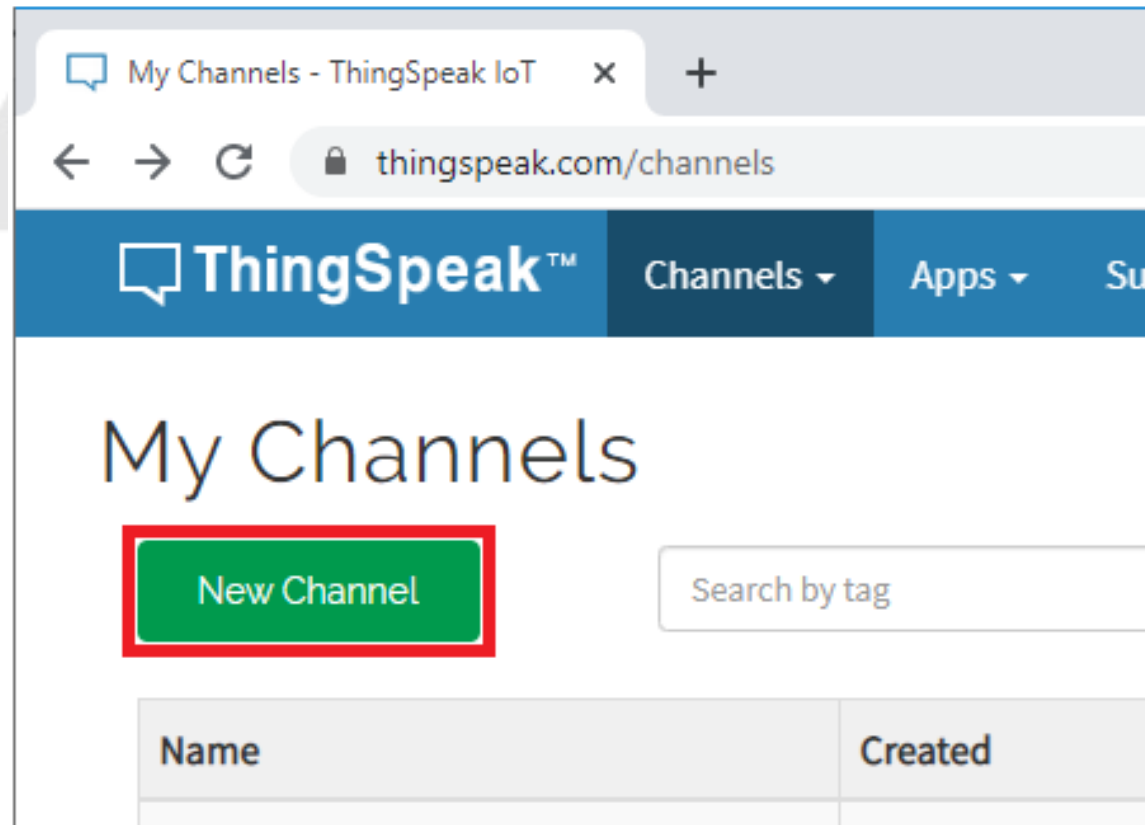

Creating New Channel

- After your account is ready, sign in, open the “Channels” tab and select “My Channels”.

- Press the “New Channel” button to create a new channel.

- Type a name for your channel and add a description. In this example, we'll just publish temperature.
- If you want to publish multiple readings (like humidity and pressure), you can enable more fields.

New Channel

Name

BME280 Readings

Description

Readings from BME280 (ESP32)

Field 1

Temperature

Field 2

Field 3

- Click the Save Channel button to create and save your channel.

Customizing Chart

- The chart can be customized, go to your Private View tab and click on the edit icon.

The screenshot displays the ThingSpeak web interface. At the top, there are five tabs: 'Private View' (highlighted with a red box), 'Public View', 'Channel Settings', 'Sharing', and 'API Keys'. Below the tabs are three buttons: '+ Add Visualizations', '+ Add Widgets', and 'Export recent data'. Underneath these is the 'Channel Stats' section, which shows 'Created: about a minute ago' and 'Entries: 0'. The main area features a chart titled 'Field 1 Chart'. The chart's header bar includes icons for share, comment, edit (highlighted with a red box and a red arrow), and close. The chart itself is titled 'BME280 Readings' and has a y-axis labeled 'Temperature' and an x-axis labeled 'Date'. The ThingSpeak logo is visible in the bottom right corner of the chart area.

- You can give a title to your chart, customize the background color, x and y axis, and much more.

Field 1 Chart Options

Title:	<input type="text" value="BME280 Temperature"/>	Timescale:	<input type="text" value=""/>
X-Axis:	<input type="text" value="Timestamp"/>	Average:	<input type="text" value=""/>
Y-Axis:	<input type="text" value="Temperature °C"/>	Median:	<input type="text" value=""/>
Color:	<input type="text" value="#d62020"/>	Sum:	<input type="text" value=""/>
Background:	<input type="text" value="#ffffff"/>	Rounding:	<input type="text" value=""/>
Type:	<input type="text" value="line"/>	Data Min:	<input type="text" value=""/>
Dynamic?:	<input type="text" value="true"/>	Data Max:	<input type="text" value=""/>
Days:	<input type="text" value=""/>	Y-Axis Min:	<input type="text" value=""/>
Results:	<input type="text" value="60"/>	Y-Axis Max:	<input type="text" value=""/>

API Key

- To send values from the ESP32 to ThingSpeak, you need the Write API Key.
- Open the “API Keys” tab and copy the Write API Key to a safe place because you’ll need it in a moment.

Write API Key

Key

HE00X0H.7W144444

Generate New Write API Key

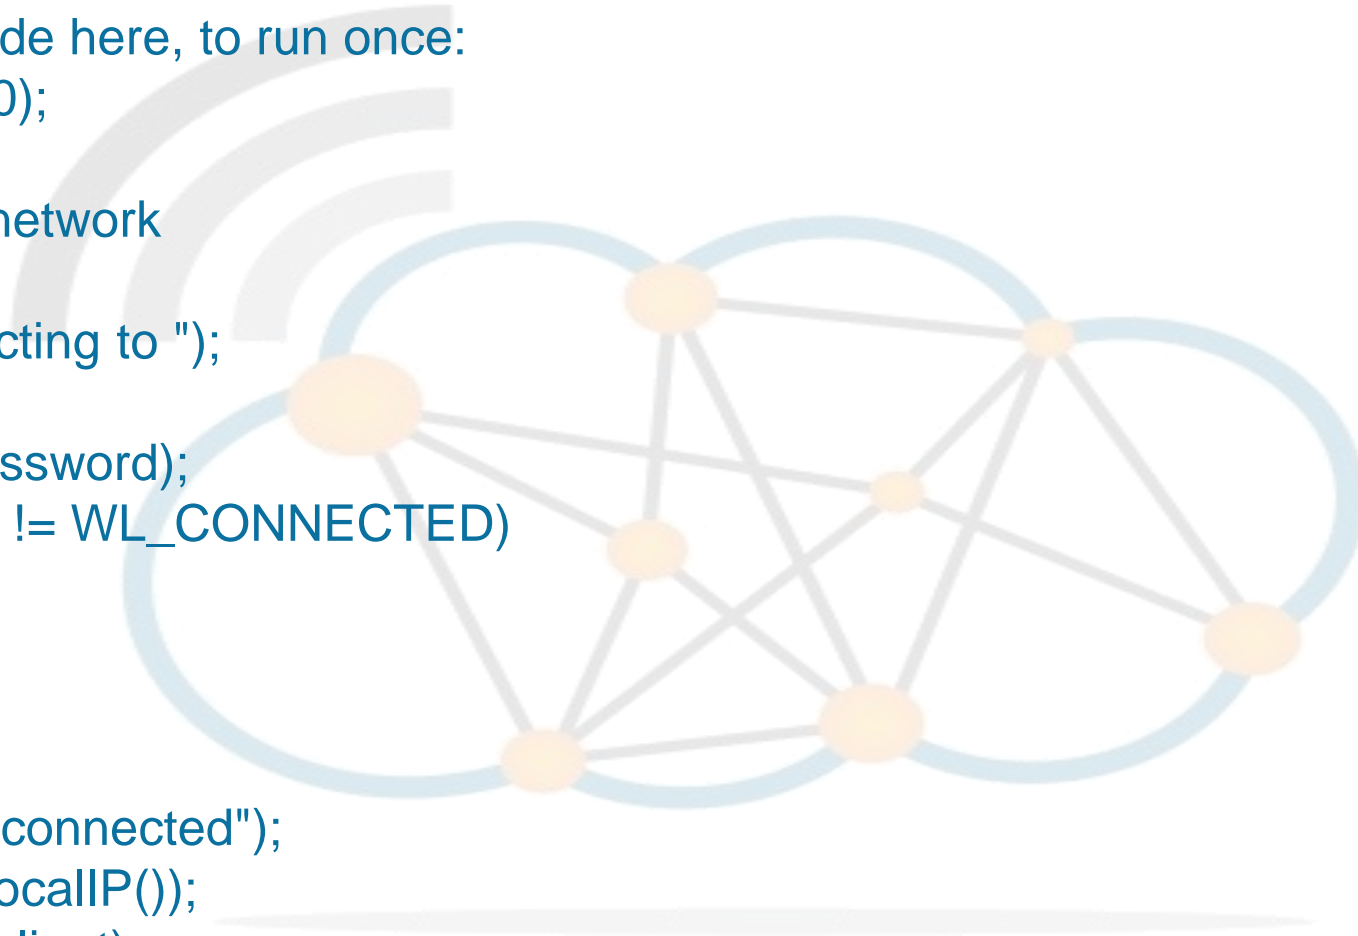

Sending DHT Sensor Readings to ThingSpeak

```
#include <WiFi.h>
#include "ThingSpeak.h"
#include <DHT.h>
#define DHTPIN 2
#define DHTTYPE DHT22
DHT dht(DHTPIN, DHTTYPE);
const char* ssid = "Cheap Hardware @ 2K";
const char* password = "passwordyoo";
WiFiClient client;
unsigned long myChannelNumber = 1924259;
const char * myWriteAPIKey = "V7YB32F9PMLB9JXU";
```

```
void setup() {  
  // put your setup code here, to run once:  
  Serial.begin(115200);  
  dht.begin();  
  // Connect to WiFi network  
  Serial.println();  
  Serial.print("Connecting to ");  
  Serial.println(ssid);  
  WiFi.begin(ssid, password);  
  while (WiFi.status() != WL_CONNECTED)  
  {  
    delay(500);  
    Serial.print(".");  
  }  
  Serial.println("WiFi connected");  
  Serial.println(WiFi.localIP());  
  ThingSpeak.begin(client);  
}
```

```
void loop() {  
  // put your main code here, to run repeatedly:  
  float tempC = dht.readTemperature();  
  float humi = dht.readHumidity();  
  Serial.print("Temperature Value is :");  
  Serial.print(tempC);  
  Serial.print("C ");  
  Serial.print("Humidity Value is :");  
  Serial.print(humi);  
  Serial.println("% ");  
  // set the fields with the values  
  ThingSpeak.setField(1, tempC);  
  ThingSpeak.setField(2, humi);  
  // Write to ThingSpeak. There are up to 8 fields in a channel, allowing you to store up to 8 different  
  int x = ThingSpeak.writeFields(myChannelNumber, myWriteAPIKey);  
  
  if(x == 200){  
    Serial.println("Channel update successful.");  
  }  
  else{  
    Serial.println("Problem updating channel. HTTP error code " + String(x));  
  }  
  delay(2000);  
}
```
